Math 179 SP24
Homework 1
Monday, Feb 4, 2024

Feel free to work with other students, but make sure you write up the homework and code on your own (no copying homework *or* code; no pair programming). Feel free to ask students or instructors for help debugging code or whatever else, though. The starter code for problem 2 part c and d can be found under the Resource tab on course website.

Note: You need to create a Github account for submission of the coding part of the homework. Please create a repository on Github to hold all your code and include your Github account username as part of the answer to problem 2.

1 (**Linear Transformation**) Let $\mathbf{y} = A\mathbf{x} + \mathbf{b}$ be a random vector. show that expectation is linear:

$$\mathbb{E}[\mathbf{y}] = \mathbb{E}[A\mathbf{x} + \mathbf{b}] = A\mathbb{E}[\mathbf{x}] + \mathbf{b}.$$

Also show that

$$\mathrm{cov}[\mathbf{y}] = \mathrm{cov}[A\mathbf{x} + \mathbf{b}] = A\mathrm{cov}[\mathbf{x}]A^\top = A\mathbf{\Sigma}A^\top.$$

a) We need to show that for random vector $\mathbf{y} = A\mathbf{x} + \mathbf{b}$, the expectation $\mathbb{E}[\mathbf{y}]$ equals $A\mathbb{E}[\mathbf{x}] + \mathbf{b}$. Since $\mathbb{E}$ is a linear operator, it is closed under addition and scalar multiplication.

$$\begin{aligned}
\mathbb{E}[\mathbf{y}] &= \mathbb{E}[A\mathbf{x} + \mathbf{b}] \\
&= \mathbb{E}[A\mathbf{x}] + \mathbb{E}[\mathbf{b}] && \text{(by additivity)} \\
&= A\mathbb{E}[\mathbf{x}] + \mathbf{b} && \text{(by homogeneity and since } \mathbf{b} \text{ is constant)}
\end{aligned}$$

b) The definition of covariance is:

$$\mathrm{Cov}[\mathbf{x}] = \Sigma = \mathbb{E}[(\mathbf{x} - \mathbb{E}[\mathbf{x}])(\mathbf{x} - \mathbb{E}[\mathbf{x}])^T$$

$$\begin{aligned}
\mathrm{Cov}[\mathbf{y}] &= \mathrm{Cov}[A\mathbf{x} + \mathbf{b}] \\
&= \mathbb{E}[(A\mathbf{x} + \mathbf{b} - \mathbb{E}[A\mathbf{x} + \mathbf{b}])(A\mathbf{x} + \mathbf{b} - \mathbb{E}[A\mathbf{x} + \mathbf{b}])^T] \\
&= \mathbb{E}[(A\mathbf{x} + \mathbf{b} - A\mathbb{E}[\mathbf{x}] - \mathbf{b})(A\mathbf{x} + \mathbf{b} - A\mathbb{E}[\mathbf{x}] - \mathbf{b})^T] \\
&= \mathbb{E}[(A\mathbf{x} - A\mathbb{E}[\mathbf{x}])(A\mathbf{x} - A\mathbb{E}[\mathbf{x}])T] \\
&= \mathbb{E}[A(\mathbf{x} - \mathbb{E}[\mathbf{x}])(\mathbf{x} - \mathbb{E}[\mathbf{x}])^\top A^T] \\
&= A\mathbb{E}[(\mathbf{x} - \mathbb{E}[\mathbf{x}])(\mathbf{x} - \mathbb{E}[\mathbf{x}])^T]A^T \\
&= A\mathrm{Cov}[\mathbf{x}]A^T \\
&= A\Sigma A^T
\end{aligned}$$

■

2 Given the dataset $\mathcal{D} = \{(x, y)\} = \{(0, 1), (2, 3), (3, 6), (4, 8)\}$

(a) Find the least squares estimate $y = \boldsymbol{\theta}^\top \mathbf{x}$ by hand using Cramer's Rule.

(b) Use the normal equations to find the same solution and verify it is the same as part (a).

(c) Plot the data and the optimal linear fit you found.

(d) Find randomly generate 100 points near the line with white Gaussian noise and then compute the least squares estimate (using a computer). Verify that this new line is close to the original and plot the new dataset, the old line, and the new line.

a) Assuming the linear model of the form: $y = \theta_0 + \theta_1 x$
From the question, we get matrix X and vector $\mathbf{y}$.

$$X = \begin{bmatrix} 1 & 0 \\ 1 & 2 \\ 1 & 3 \\ 1 & 4 \end{bmatrix}, \quad y = \begin{bmatrix} 1 \\ 3 \\ 6 \\ 8 \end{bmatrix}$$

The normal equation is $X^T X\theta = X^T \mathbf{y}$.

$$X^T X = \begin{bmatrix} 4 & 9 \\ 9 & 29 \end{bmatrix}, X^T \mathbf{y} = \begin{bmatrix} 18 \\ 56 \end{bmatrix}$$

Using Cramer's Rule, $\theta_0 = \dfrac{\begin{vmatrix} 18 & 9 \\ 56 & 29 \end{vmatrix}}{\begin{vmatrix} 4 & 9 \\ 9 & 29 \end{vmatrix}} = \frac{18}{35}$ and $\theta_1 = \dfrac{\begin{vmatrix} 4 & 18 \\ 9 & 56 \end{vmatrix}}{\begin{vmatrix} 4 & 9 \\ 9 & 29 \end{vmatrix}} = \frac{62}{35}$

b) Rearranging the normal equation stated before, we get $\theta = (X^T X)^{-1} X^T \mathbf{y}$

$$\begin{aligned}
\theta &= (X^T X)^{-1} X^T \mathbf{y} \\
&= \begin{bmatrix} 4 & 9 \\ 9 & 29 \end{bmatrix}^{-1} \begin{bmatrix} 1 & 1 & 1 & 1 \\ 0 & 2 & 3 & 4 \end{bmatrix} \begin{bmatrix} 1 \\ 3 \\ 6 \\ 8 \end{bmatrix} \\
&= \frac{1}{35} \begin{bmatrix} 29 & -9 \\ -9 & 4 \end{bmatrix} \begin{bmatrix} 1 & 1 & 1 & 1 \\ 0 & 2 & 3 & 4 \end{bmatrix} \begin{bmatrix} 1 \\ 3 \\ 6 \\ 8 \end{bmatrix} \\
&= \frac{1}{35} \begin{bmatrix} 18 \\ 62 \end{bmatrix} \\
&= \begin{bmatrix} \frac{18}{35} \\ \frac{62}{35} \end{bmatrix}
\end{aligned}$$

This is equivalent to the answer from part (a) c)

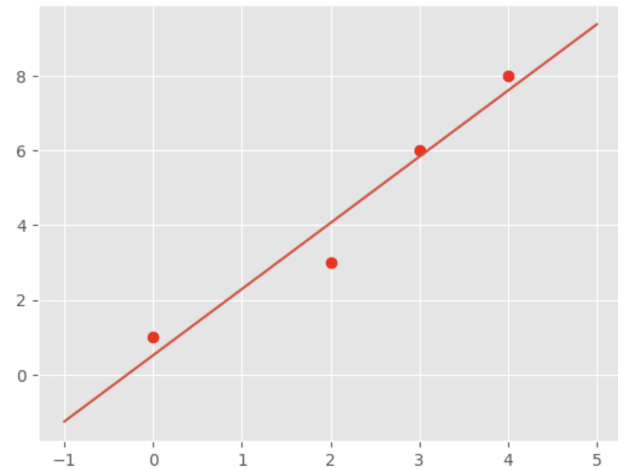

Figure 1: Scatter plot of dataset D with optimal linear fit

d)

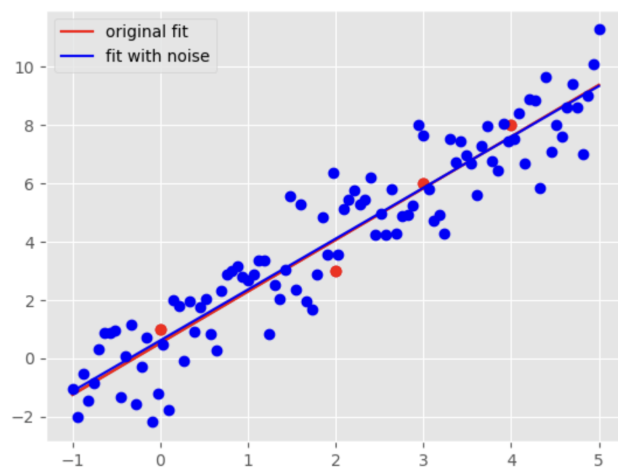

Figure 2: Scatter plot of dataset D with optimal linear fit and white Gaussian noise
